

The dropdown suggestions in your image are most likely coming from the Google Places Autocomplete API. When you type "miya", Google searches its location database and returns matching places like Miyapur, Madhapur, societies, landmarks, etc.

How it works

1. User types in the search box.
2. Frontend sends the text ("miya") to Google Places API.
3. Google returns matching locations.
4. The dropdown displays those suggestions.
5. When a user selects one, you get:
 - Place Name
 - Address
 - Latitude
 - Longitude
 - Place ID

Step 1: Get a Google Maps API Key

Go to:

[Google Cloud Console](https://console.cloud.google.com/welcome/new?utm_source=chatgpt.com&pli=1):

https://console.cloud.google.com/welcome/new?utm_source=chatgpt.com&pli=1

Enable:

- Places API
 - Maps JavaScript API
-

Step 2: Install React Google Places Autocomplete

- `npm install react-google-autocomplete`

Step 3: React Component

```
import Autocomplete from "react-google-autocomplete";
```

```
function SearchLocation() {  
  return (  
    <Autocomplete  
      apiKey="YOUR_GOOGLE_API_KEY"  
      style={{  
        width: "100%",
```

```

    height: "45px",
    padding: "10px"
  }}
  onPlaceSelected={({place}) => {
    console.log(place);

    const lat = place.geometry.location.lat();
    const lng = place.geometry.location.lng();

    console.log("Latitude:", lat);
    console.log("Longitude:", lng);
  }}
  options={{
    types: ["geocode"],
    componentRestrictions: { country: "in" }
  }}
/>
);
}

export default SearchLocation;

```

=====

Alternative: Store Locations in MongoDB

If you don't want Google APIs, create your own collection:

```

[
  {
    "name": "Miyapur",
    "city": "Hyderabad"
  },
  {
    "name": "Madhapur",
    "city": "Hyderabad"
  },
  {
    "name": "Manikonda",
    "city": "Hyderabad"
  }
]

```

Backend Search API:

```

app.get("/search", async (req, res) => {
  const keyword = req.query.q;

  const locations = await Location.find({
    name: {
      $regex: keyword,

```

```
$options: "i"  
}  
});
```

```
res.json(locations);  
});
```

Frontend:

```
axios.get(`/search?q=${searchText}`);
```

```
=====
```

Creating API Key using Google Cloud , in Certain charges “The [Google Maps Platform](#) operates on a pay-as-you-go model where **all accounts receive a free \$200 monthly credit**, which covers a significant amount of baseline usage. Costs are calculated per 1,000 requests”(\$ 2.10 and \$0.85)
